Overview

This report analyzes **spatial gaps** in the national biodiversity occurrence data, examining geographic coverage patterns across EEA reference grids at 10km and 50km resolutions.

Key questions addressed:

- What proportion of the study area has biodiversity occurrence data?
- Where are the geographic gaps in sampling coverage?
- How does coverage vary by evidence type (basis of record)?
- Which areas should be prioritized for future sampling efforts?

1. Spatial Coverage Summary

1.1 Grid Resolution Comparison

Table 1: Spatial Coverage by Grid Resolution

grid	n_cells_total	n_cells_with_data	cells_zero	pct_coverage	total_occurrences	mean_per_cell	median_per_cell
grid10km	6,988	6,284	704	89.9	134,235,995	19,209.5	2,354.5
grid50km	336	332	4	98.8	134,238,011	399,517.9	86,993.0

3.2 Coverage Comparison Across Basis Types

4. Priority Areas

4.1 Zero Coverage Cells

708 cells have zero coverage across all basis types.

4.2 Priority Cells Map

Priority Areas: Zero Coverage Cells

704 cells requiring sampling attention

Status ■ Has Data ■ Zero Coverage
Red cells have no occurrence records across any evidence type

4.3 Low Coverage Analysis

Cells with very low coverage (bottom 10%):

##

- Threshold: 1 occurrences- Number of cells: 1,353

5. Key Findings

Spatial Coverage Summary

Grid Coverage:

- grid10km: 89.93% coverage (6,284 / 6,988 cells)
- grid50km: 98.81% coverage (332 / 336 cells)

Priority Areas:

- Zero coverage cells: 708
- Very low coverage cells (bottom 10%): 1,353

Best Coverage by Evidence Type:

- humanObservation: 82.9% coverage
- preservedSpecimen: 81.7% coverage
- materialSample: 48.5% coverage

Recommendations:

1. Target zero-coverage cells for systematic biodiversity surveys
2. Prioritize mountain and northern regions if they show lower coverage
3. Leverage citizen science programs to expand geographic reach
